Imagine a strong-spoked flywheel, with toroidal weights around each spoke, dampened by springs. As the flywheel starts spinning, the weights move outward, thus limiting the RPMs to some max. With the right tuning of weights, springs, etc., maybe the flywheel would run at some constant RPM over a large range of stored energy values.

Experimental Flywheel: NASA: Public Domain. In the event a green community or local power grid becomes short of power, a flywheel could drive a generator. This might happen when clouds obscure the sun. Or the wind drops in the evening. A short while later, reliable battery storage takes over to sustain the grid.

A flywheel-battery hybrid storage system has been installed in Ireland, a system that the companies involved claim is the first of its kind. The system includes two 160kW by US manufacturer Beacon and a Hitachi 160kW/576kWh deep-cycle lead-acid battery. The power conversion system was provided by German company Freqcon.

The hybrid system combines 8.8MW / 7.12MWh of lithium-ion batteries with six flywheels adding up to 3MW of power. It will provide 9MW of frequency stabilising primary control power to the transmission grid operated by TenneT and is located in Almelo, a city in the Overijssel province in the east Netherlands.

As the only global provider of long-duration flywheel energy storage, Amber Kinetics extends the duration and efficiency of flywheels from minutes to hours-resulting in safe, economical and ...

For a flywheel, this depends on both the amount of mass it has and how that mass is spread out around its spinning axis. If you add more mass to the flywheel, you increase its moment of inertia. This means the flywheel can store more energy at the same speed. So, a heavier flywheel can hold more energy and deliver more power when needed.

Flywheel Battery Calculations. A flywheel battery can spin at up to 100,000 rpm. The formula for the kinetic energy of a rotating mass is given by  $E = \frac{1}{2} I \omega^2$ , Where I is the moment of inertia and  $\omega$  is the angular velocity. For a thick walled cylinder, such as would be used in a flywheel battery,  $I = \frac{1}{2} m (r_1^2 + r_2^2)$ , where
