Can a microgrid form a distribution network?

Distribution networks have undergone a series of changes, with the insertion of distributed energy resources, such as distributed generation, energy storage systems, and demand response, allowing the consumers to produce energy and have an active role in distribution systems. Thus, it is possible to form microgrids.

Should microgrids be added to active distribution grids?

From the results presented in Table 2, it can be seen that adding microgrids to active distribution grids, in general, is beneficial in terms of economic and technical aspects because the costs are not greatly increased (scenarios 1 and 2). The microgrids have enough energy and try to contribute to the grid by injecting energy.

Do microgrids and other distributed resources reduce power losses and operation costs?

So, in general, both microgrids and other distributed resources that can be incorporated into the active grid, if their operation and the DERs were appropriately optimized/allocated, tend to decrease power losses and operation costs of active grids with microgrids and other DERs.

What is an active distribution network?

1. Introduction An active distribution network is a new concept associated with distribution networks that present distributed energy resources (DERs) as distributed generation, controllable loads, and storage systems, as well as new monitoring, communication, and controls, which allow the supervision and management of the resources placed.

How do microgrids contribute to the grid?

The microgrids have enough energy and try to contribute to the grid by injecting energy. In scenarios where there is an increased load (3 and 4), there is a clear reduction in the total costs from the microgrid due to the injection of energy from the microgrid and the DERs to the grid.

Is it possible to form a microgrid?

Thus, it is possible to form microgrids. From the active grid's point of view, it is necessary to plan the operation considering the distributed resources and the microgrids connected to it, aiming to ensure the maintenance of grid economy and operational safety.
