What are base year costs for utility-scale battery energy storage systems?

Base year costs for utility-scale battery energy storage systems (BESSs) are based on a bottom-up cost model using the data and methodology for utility-scale BESS in (Ramasamy et al., 2023). The bottom-up BESS model accounts for major components, including the LIB pack, the inverter, and the balance of system (BOS) needed for the installation.

Values range from 0.948 to 1.11. Battery storage costs have evolved rapidly over the past several years, necessitating an update to storage cost projections used in long-term planning models and other activities. This work documents the development of these projections, which are based on recent publications of storage costs.

Do projected cost reductions for battery storage vary over time?

The suite of publications demonstrates wide variation in projected cost reductions for battery storage over time. Figure ES-1 shows the suite of projected cost reductions (on a normalized basis) collected from the literature (shown in gray) as well as the low, mid, and high cost projections developed in this work (shown in black).

The observed difference in LCOE between utility-scale PV-plus-battery and utility-scale PV technologies (for a given year and resource bin) is roughly in line with empirical power purchase agreement price data for PV-plus-battery systems with comparable battery sizes (Bolinger et al., 2023). However, it is important to note there are inherent ...

Small-scale battery storage also continues to grow, especially in California, but also in other regions of the United States: In 2019, 402 MW of small-scale total battery storage power capacity existed in the United States. California accounts for 83% of all small-scale battery storage power capacity.

To better understand BESS costs, it's useful to look at the cost per kilowatt-hour (kWh) stored. As of recent data, the average cost of a BESS is approximately \$400-\$600 per kWh. Here's a simple breakdown: Battery Cost per kWh: \$300 - \$400; BoS Cost per kWh: \$50 - \$150; Installation Cost per kWh: \$50 - \$100; O& M Cost per kWh (over 10 years ...

This year Bloomberg New Energy Finance [4] reported that a 100 MW project (which would entail a 400-megawatt-hour (MWh) battery installation) could cost around \$169 million (A\$220 million). When considering the price of the batteries, one must also include the costs of shipping, installation, and associated necessary hardware.

For solar-plus-storage, the MMP benchmark for residential systems grew 6% year-on-year to US\$38,295 while utility-scale costs grew 11% to a benchmark of US\$195 million. Commercial was US\$1.44 million. Within solar-plus-storage, the MMP benchmark is 13-15% higher than the MSP for all three segments.

What is grid-scale battery storage? Battery storage is a technology that enables power system operators and utilities to store energy for later use. A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time

A typical utility-scale battery storage system, on the other hand, is rated in megawatts and hours of duration, such as Tesla's Mira Loma Battery Storage Facility, which has a rated capacity of 20 megawatts and a 4-hour duration (meaning it can store 80 megawatt-hours of usable electricity).
