How does a wind turbine work?

When the wind blows, it pushes the blades of the turbine and makes them spin. This spinning turns a shaft inside the turbine, which powers a generator, which turns the kinetic energy of the spinning motion into electricity. Regular wind turbines are usually very tall, and have gigantic blades, to catch as much wind power as possible.

How to choose a wind turbine blade?

For a residential turbine, maintaining a chord that is proportionate and harmonically balanced with the length of the blade is essential. This balance ensures the blades are effective in capturing wind energy while maintaining structural integrity and operational safety. 2. Choosing the Right Number of Blades for Your DIY Wind Turbine

How does a microwind turbine work?

When the wind is strong enough it turns the blades of the turbine, generating electricity. The U.K. climate is ideal for wind harnessing technologies as 40% of the wind in Europe is experienced here, and in the right area you should be able to see substantial savings on your electricity bills.
