

It is easy to freeze inside the energy storage cabinet

How do I choose a kitchen cabinet for a fridge freezer?

Pay attention to height, width, and depth, allowing extra space for ventilation if required. If your kitchen cabinet does not already have a designated space for the integrated fridge freezer, you may need to remove or modify a cabinet to accommodate it. Ensure the cabinet is level and sturdy.

Does a modified freezer save energy based on a PCM integration?

The freezer was tested with and without the PCM integration. The results of the modified freezer indicated energy savings of 2.53-8.37% based on phase change temperature of PCM. It was revealed that the increase in phase change temperature causes an increase in energy consumption due to the higher temperature difference with cabinet temperature.

How do I maintain my integrated fridge freezer?

Here are maintenance tips to ensure the longevity and efficient operation of your integrated fridge freezer: Regularly clean the interior of the fridge and freezer compartments using a mild, non-abrasive cleaner and warm water. Avoid using harsh chemicals. Periodically defrost the freezer to remove ice build-up.

What temperature should a back-up freezer be stored at?

Even if your samples do benefit from being stored at -80°C it is a good idea to run your back-up freezers ("hotel freezers") at -70°C or even -60°C to reduce energy consumption, and then adjust them to -80°C when required.

How do I fit an integrated fridge freezer in my Kitchen?

To measure the available space in your kitchen for fitting an integrated fridge freezer, follow these steps: Measure from the floor to the underside of the kitchen worktop or cabinet, allowing clearance for ventilation. Measure the available width, considering surrounding cabinets and appliances to ensure a comfortable fit.

Do door openings increase the energy consumption of a freezer?

Energy consumption tests revealed that door openings increased the energy consumption of the freezer by 11-17% and defrost cycles by 15-21%. This consumption increment is due to the longer period of compressor operation in order to remove the introduced heat loads during the conditions of door opening and defrosting.
