Mechanical energy storage systems can be found either as pure mechanical (MESS) or combined with electrical (EMESS). The main difference is in the utilization of stored energy if it is directly used or transmitted via an electric motor-generator. Usually EMESSs are used to supply the grid with electricity.

Our Know-how for High-performance Storage Systems. Energy has to be ready when it is needed. For that reason, the high volatility of power grids must be balanced by an increasing percentage of renewable energy. This creates increasing demand for load balancing technologies and for intelligent, high-performance battery storage systems.

4. Pumped Hydroelectric Storage (PHS) o 70-85% of electrical energy is recovered o Energy loss due to evaporation and Pump/generator inefficiency o Currently the most cost effective way to store large amounts of electricity o Low energy density calls for large bodies of water o Never used in portable technology o 1000 kg at 100 ft = .272 kWh

The only solution to continue improving renewables is the energy storage. For these reasons the increase in scientific research into energy storage systems is highly desirable. The use of an Energy Storage System (ESS) can raise the energy production efficiency [7], [8]. It is charged with energy surplus coming from the production phase, while ...
