Iron-air batteries work on the principle of reversible rusting. When the battery is discharging energy, the system takes in oxygen from the air and converts the iron metal into iron oxide, otherwise known as rust. While the battery is charging, an electrical current converts the rust back into iron, and the system expels oxygen.

Toyota uses nickel-metal hydride batteries for some of its hybrid vehicles. It has a "sweep" function, developed by in-house by Toyota's R& D department, which the firm describes as a device that can freely control energy discharge by switching electricity flow on and off through series-connected batteries in microseconds.
