How efficient are PV panels compared to a reference PV panel?

The performance of these systems was compared against a reference PV panel with no cooling (PV1). Compared to the electrical efficiency of 12.8 % for PV, the systems PV3, PV4, PV5, and PV6 showed efficiencies of 13.3 %, 14 %, 13 %, and 12.8 %, respectively.

Does a PV panel increase system efficiency?

Kiwan et al. performed a similar study using mathematical modeling using paraffin graphite panels of 15 mm thickness covering the back of the PV panel. The experimental results showed that, if the average operating temperature of the PV is higher than the PCM melting point, there is an increase in system efficiency.

How to reduce the temperature of a PV panel?

Deokar et al. employed an active cooling system for reducing the temperature of a PV panel and recovering the waste heat to dry onion flakes. Mild steel chips and thermal grease were applied at the back of the PV panel to act as a heat sink. A 16.1 °C temperature drop was recorded using this method.

What is the maximum temperature of a PV panel?

The maximum recorded values of temperature for uncooled, passively cooled, and actively cooled PV panels were found to be 58 °C, 55 °C, and 38 °C, respectively. Compared to the uncooled panel, the power output was increased by 7 % for fin cooling and 10.2 % for water cooling.

What is the performance of a Modified PV panel?

The performance of this setup was compared with a similar PV panel without any modifications. The system recorded a total average water consumption of 1.5 L. The average temperature of the modified panel was reduced by 14.61 °C which enhanced the electrical efficiency by 6.8 %.

How to increase temperature uniformity in PV panels?

Also the use of variable flow rate of coolant can increase temperature uniformity across the surface of the PV panel. Adding nanoparticles to liquid is a promising option which can attain a large amount of heat removal rates.
