Should I install solar PV & solar thermal panels on my roof?

Given the cost of the solar PVT panels and the relatively small number of installers, the general consensus is that if you have enough room on the roof then going for separate solar PV and solar thermal systems could be the best option. The solar PV and the solar thermal panel systems can then be sized properly and the energy use optimised.

What are solar PV-T panels & how do they work?

Solar PV-T panels are able to do this because they are made up of two components: a photovoltaic element, designed to absorb light, and a solar thermal component, designed to capture the sun's heat. Aside from their dual role, hybrid solar panels also have the added benefit of increasing electrical output and making it more efficient.

Should you use solar photovoltaic and solar thermal technology together?

The most obvious benefit from pairing solar photovoltaic and solar thermal technology is the space saving. Many people install photovoltaic panels and solar thermal panels separately, whereas having a hybrid means you only need one panel, which is great if you have a limited amount of roof space.

How do solar PV panels work?

The panels are bolted to these rails. Solar PVT panels will require the wires from the PV function to lead back to an inverter to turn it into usable energy, as well as pipes connecting to the home's hot water storage for its solar thermal component.

Can a hybrid solar PVT module produce electricity and heat simultaneously?

A hybrid solar PVT module can therefore produce both electricity and heat simultaneously. While combining these systems may sound like a no-brainer, the technology does have limitations in comparison to separate PV and thermal solar panels.

How much heat does a hybrid solar PV system produce?

That would be around 1000kWh of electricity and around 500Wh of heat. The hybrid solar PVT panels can produce more heat than this but that could then be too hot for the PV cells. The crucial design details would be to make sure that you can use all the generated energy but also not overheat the PV cells.
