What is solar energy & how does it work?

Solar energy can be part of a mixture of renewable energy sources used to meet the need for electricity. Using photovoltaic cells (also called solar cells), solar energy can be converted into electricity. Solar cells produce direct current (DC) electricity and an inverter can be used to change this to alternating current (AC) electricity.

How do solar cells produce electricity?

Solar cells convert the light from the sun into electricity. Many solar cells can be put together to make a solar panel. Solar cells are made from a material called silicon. - Solar panels are used to produce electricity. They can be found on buildings but can also be used on a solar farm to harvest the power of the sun.

How can solar energy be converted into electricity?

Using photovoltaic cells (also called solar cells), solar energy can be converted into electricity. Solar cells produce direct current (DC) electricity and an inverter can be used to change this to alternating current (AC) electricity. This electricity can be stored in batteries or other storage mechanisms for use at night.

How solar energy is generated?

The PV technology convert visible spectrum to electricity and thermal collectors use both infrared and visible spectrum for energy generation. So the energy generation from solar radiation can be in the form of electrical energy or thermal Energy. The various conversion paths of solar energy is described in the Fig.2

How do I set up a solar cell experiment?

Set up your experiment as shown in Figure 1. Connect the multimeter probes to the solar cell's alligator clip leads. If you need help using a multimeter, check out the Science Buddies reference [How to Use a Multimeter](#). Set up the lamp a fixed height above the solar cell on a flat surface.

Are solar-powered robots a 'green' energy source?

You have probably heard about using renewable energy sources like wind and solar power to provide electricity to homes and buildings, as well as hybrid or fully electric cars that use less (or zero) gasoline. But what about solar-powered robots? As robots become more common, it is increasingly important to use "green" energy sources to power them.
