

2.1 Parabolic-trough STPS. The concept of parabolic-trough solar thermal technology is to focus the solar beam on the solar collector and to heat the heat transfer oil or ...

Currently, the SRC is the most widespread and commercially available power block option, either coupled to a PTC solar field working with thermal oil, and generating steam at 370-390°C and 100 bar or coupled to a ...

Based on the current solar thermal energy efficiency, an average CSP plant such as a tower solar power plant, dish Stirling, or parabolic trough plant requires the use of a land area of approximately 10 acres per megawatt ...

In the present review, parabolic trough collector (PTC) and linear Fresnel reflector (LFR) are comprehensively and comparatively reviewed in terms of historical background, technological ...

OverviewEfficiencyDesignEnclosed troughEarly commercial adoptionCommercial plantsSee alsoBibliographyA parabolic trough collector (PTC) is a type of solar thermal collector that is straight in one dimension and curved as a parabola in the other two, lined with a polished metal mirror. The sunlight which enters the mirror parallel to its plane of symmetry is focused along the focal line, where objects are positioned that are intended to be heated. In a solar cooker, for example, food is placed at the foc...

The SunBeam is a new utility-scale parabolic trough solar collector developed by our experienced team. With large 8.2m x 21m (27ft x 68ft) concentrator modules that generate economies of size and simplification throughout the solar field, ...
