

What is solar thermal energy?

Solar thermal energy (STE) is a form of energy and a technology for harnessing solar energy to generate thermal energy for use in industry, and in the residential and commercial sectors. Solar thermal collectors are classified by the United States Energy Information Administration as low-, medium-, or high-temperature collectors.

What is a solar thermal power plant?

Solar thermal power plants are active systems, and while there are a few types, there are a few basic similarities: Mirrors reflect and concentrate sunlight, and receivers collect that solar energy and convert it into heat energy. A generator can then be used to produce electricity from this heat energy.

Can solar thermal energy be used for process heat applications?

Therefore, the solar thermal energy system is considered to be one of the attractive solutions for producing thermal energy for process heat applications. Hence, there is tremendous opportunity to replace conventional energy sources with solar thermal energy systems.

What is solar thermal power generation?

Harnessing solar energy for electric power generation is one of the growing technologies which provide a sustainable solution to the severe environmental issues such as climate change, global warming, and pollution. This chapter deals with the solar thermal power generation based on the line and point focussing solar concentrators.

Are solar thermal energy systems suitable for industrial applications?

The solar thermal energy systems performance for industrial applications are analyzed in the earlier previous studies to identify suitable solar thermal technology for various industrial process heat applications and are briefed in Table 2.

What are the different types of solar energy conversion technologies?

Solar energy conversion technologies may be broadly classified into solar photovoltaic (PV) and solar thermal energy systems. Solar PV systems convert solar radiation into electricity directly and thermal systems convert solar radiation into heat.

Based on the current solar thermal energy efficiency, an average CSP plant such as a tower solar power plant, dish Stirling, or parabolic trough plant requires the use of a land area of approximately 10 acres per megawatt ...
