

The air inlet and exhaust area of the generator set

What is a diesel generator air intake & exhaust system?

The diesel generator air intake and exhaust system (DGAIES) provides the diesel engine with combustion air from the outside. The combustion air passes through a filter and silencer before being compressed by a turbocharger and cooled by the coolant system before entering the individual cylinders for combustion.

What is the intake system of a diesel generator set?

The intake system of the diesel generator set is equipped with dry air filter and air filter and air resistance indicator, with exhaust gas turbocharger, full intake and guaranteed performance.

Where should the air door be set on a diesel generator?

The air door can be set at the connection between the tuyere and the outdoor, which is normally closed, and can be automatically turned on when the unit is running. Considering the air intake, exhaust and smoke exhaust of the diesel generator set, the machine room is preferably located in the first floor if possible.

Where should a diesel generator room be located?

1. Determination of diesel generator room: Considering the air intake, exhaust and smoke exhaust of the diesel generator set, the machine room is preferably located in the first floor if possible.

Where should exhaust air be sourced for a generator?

For generators with remote radiators, it is recommended that the exhaust air should be sourced as high as possible and directly above the generator sets. Significant bypass of ventilation airflow directly into the discharge airflow will lead to reduction in cooling effectiveness and elevated temperatures within the room.

How should a generator be ventilated?

Preferably, the source of ventilation air should be as low as possible and the air should flow over the entire generator set, thereby cooling the alternator, engine block, and radiator (for sets with unit-mounted radiators) to remove the after-cooler and jacket-water heat.

The location of a Generac generator plays a pivotal role in determining the effectiveness of its exhaust system. When selecting a suitable location for your generator, keep in mind that it should be installed in a clean, ...

The engine exhaust mixes with the generator set cooling air at the exhaust end of the enclosure. Mount the generator set so that the hot exhaust does not blow on plants or other combustible ...

Diesel generator sets require a lot of air for combustion and cooling, which is often overlooked. It is recommended that the total area of the air inlet should be at least twice the area of the unit's radiator; all air outlets ...

The air inlet and exhaust area of the generator set

The air filter inlet should be properly protected (such as a protective net) to prevent water or foreign matter from entering the diesel engine. The air inlet should be located away from all kinds of heat sources, and the exhaust gas ...

When diesel generator room adopts clean ventilation, Please calculate the intake air volume and the exhaust air volume as follows: When the generator room is air cooled, the intake air ...

To prevent the return of hot air, the inlet of the diesel generator set should be as far away from the exhaust outlet as possible, and the air in the machine room should be allowed to flow directly. The inlet should be protected ...

When the generator set is working, if the inhaled air contains dust and other impurities, it will aggravate the wear of the parts, so an air filter must be installed. Air filters are ...
